roam

the reels you share, pinned to a map you build together.

TEAM ROAM

ARLEEN ALCARAZ-CANO · DIYA NAIR · DANIEL DAVID · TYLER MANRIQUE · STANLEY OMONDI

Short-form video is now the new word-of-mouth.

Gen Z discovers places through reels, not reviews.

5–15+

reels/week shared
about places they want to go

0%

of those reels
ever become actual plans

100%

of the resulting
frustration

You see a reel. You think *"I need to go there."*

Then you forget. Every. Single. Time.

WHO HAS THIS PROBLEM

5–15+

reels per week shared by Gen Z about places they want to go. (estimate from user interviews)

WHAT THEY DO TODAY

Screenshot the reel.

Drop it in a notes app.

Star it on Google Maps.

When you're free, you have no idea what to do.

Three forces converged.

1

Video is the default discovery layer

Reels, TikToks, and Shorts have replaced Yelp for Gen Z. The place-finding behavior is real — it just lacks infrastructure.

2

AI extraction is finally fast enough

Multimodal models can now parse frames, captions, and overlays in under 3 seconds — making real-time reel-to-pin possible.

3

Maps as social objects are mainstream

BeReal, Snap Map, Google's collaborative lists — the habit of sharing location-based content with friends is already normalized.

THE SOLUTION

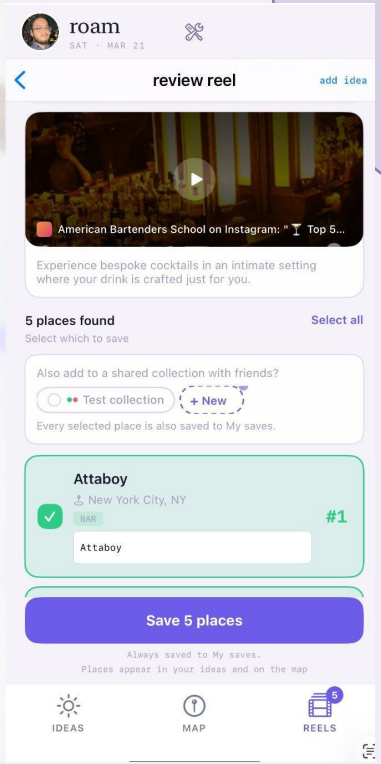
Share the reel.
We do the rest.

1. **Share**
   Tap share → Roam from Instagram or TikTok.

2. **Extract**
   AI reads the frames, captions, and metadata.

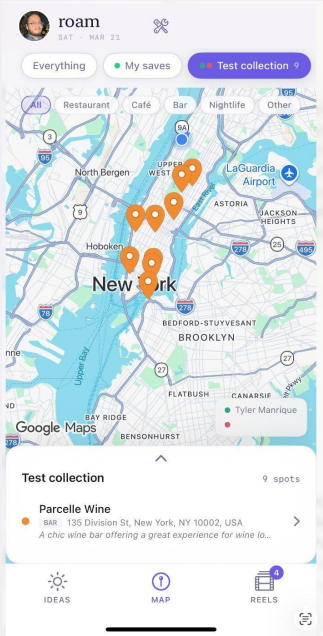
3. **Resolve**
   Each candidate matches to a real Google place.

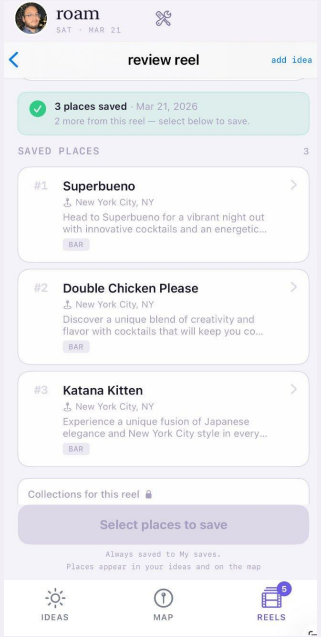
4. **Pin**
   One tap saves it to your map and your friends'.



AI extracted 5 bars from one reel

A working MVP. In production, on iOS, today.





REEL → MAP PIPELINE

Share sheet, AI extraction, candidate review, location override — all live.

SHARED COLLECTIONS

Personal map plus collections you build with friends. Each contributor color-coded.

ALSO BUILT, FLAGGED OFF

Full event coordination — invites, RSVPs, calendar — hidden behind a feature flag.

COMPETITION

No one owns the reel-to-place layer.

TOOL	WHAT IT DOES	WHAT IT MISSES
Google Maps	Save + star places	*Can't ingest video; no friend layers*
Instagram Saves	Save reels to collections	*No location extraction or map view*
TikTok Notes	Bookmark for later	*Lives inside one app; no planning*
Notion / Notes	Manual screenshot + link dump	*Completely manual; doesn't scale*
Roam	Reel ⟶ AI ⟶ shared map	—

WHERE WE ACTUALLY ARE

A bit on where we are at.

SIGNAL

- MVP shipped to iOS (waiting on review)
- Reel pipeline works end-to-end
- People who try it say it's cool
- Shared collections feel right

NOISE

- No strong pull, no one asking for access
- Messy usage data
- No clear ICP (ideal customer profile)

Freemium → premium social layer.

Free

$0

- Up to 10 reels/month
- Personal map
- 1 shared collection

Pro

$6/mo

- Unlimited reels
- Unlimited collections
- Priority AI extraction

Group

$3/person/mo

- Team pricing (3+ members)
- Shared trip planning
- Event coordination

A large market, built bottom-up.

TAM	~70M	US Gen Z social media users (18–28) discovering places via short-form video
SAM	~21M	Active short-video consumers who save place-content and express intent to visit (~30%)
SOM	~210K	Urban early adopters, discovery-driven, NYC-first — Year 1 beachhead (1% of SAM)

At $6/mo × 1% of SAM = $15M ARR at scale. Achievable in Year 3 with disciplined ICP targeting.

Five builders who live the problem.

WHAT WE WANT FROM YOU

Please give us feedback!

01

Which segment would YOU bet on?

Aesthetic curators, travel planners, or urban explorers — which would you actually use, and which is dead on arrival?

02

How should we monetize this?

Freemium with a reel cap? Premium shared collections? Group pricing? What feels right — and what would make you bounce?

03

Plans + chatbot — kill, hide, or ship?

We built an entire conversational planning experience. It's flagged off. Does it belong in Roam, or is it a different product?
